Chemistry Topic 4: Chemical calculations

1. Keywords

| Conservation of mass | Mass (or atoms) cannot be created or destroyed. |  |
| :---: | :---: | :---: |
| Relative atomic mass ( $\mathrm{A}_{\mathrm{r}}$ ) | Number of neutrons and protons. |  |
| Relative formula mass ( $\mathrm{M}_{\mathrm{r}}$ ) | Sum of relative atomic masses |  |
| Balanced equation | When the sum of the $M_{r}$ on the left = the sum of the $M_{r}$ on the right |  |
| Mole | $M_{r}$ or $A_{r}$ in grams. Mass of $6.02 \times 10^{23}$ atoms, molecules or ions. |  |
| Limiting reactant (H) | The reactant which runs out first |  |
| 2. Relative formula mass ( $\mathrm{M}_{\mathrm{r}}$ ) |  |  |
| Steps |  | Worked example - $\mathrm{CO}_{2}$ |
| Step 1 - Using the periodic table, determine relative atomic mass $\left(A_{r}\right)$ of each element. |  | $\begin{aligned} & \text { Carbon }=12 \\ & \text { Oxygen }=16 \end{aligned}$ |
| Step 2 - Multiply the relative atomic mass by the number of each atom in the molecule. |  | $\begin{aligned} & \text { Carbon }=(1 \times 12)=12 \\ & \text { Oxygen }=(2 \times 16)=32 \end{aligned}$ |
| Step 3 - Add up all the values |  | $12+32=44$ |

3. Moles

4. Equations and calculations (Higher)

## number of moles $=$ mass $\div$ relative formula mass

Worked example - Number of moles in 88 g of carbon dioxide $\left(\mathrm{CO}_{2}\right)$

Number of moles $=88 \mathrm{~g} \div 44 \mathrm{~g} / \mathrm{mol}$
Number of moles $=2$ moles

## 5. Masses to balanced equations (Higher)

Worked example - what mass of carbon is need to produce 132 g of carbon dioxide. $1 \mathrm{C}+1 \mathrm{O}_{2} \rightarrow 1 \mathrm{CO}_{2}$

|  | Carbon (C) | Carbon dioxide $\left(\mathrm{CO}_{2}\right)$ |
| :--- | :--- | :--- |
| Mass | 36 g | 132 g |
| $\mathrm{M}_{\mathrm{r}}$ or $\mathrm{A}_{\mathrm{r}}$ | $12 \mathrm{~g} / \mathrm{mol}$ | $44 \mathrm{~g} / \mathrm{mol}$ |
| Number of moles | 3 moles | 3 moles |
| Ratio | 1 |  |

## 6. Concentration

$$
\text { concentration }\left(\mathrm{g} / \mathrm{dm}^{3}\right)=\frac{\text { amount of solute }(\mathrm{g})}{\text { volume of solution }\left(\mathrm{dm}^{1}\right)}
$$

Worked example - What is the concentration of a solution when 50 g of sodium hydroxide is dissolved in $200 \mathrm{~cm}^{3}$ of water.

Volume in $\mathrm{dm}^{3}=\frac{200 \mathrm{~cm}^{3}}{1000}=0.2 \mathrm{dm}^{3}$ Concentration $=\frac{50 \mathrm{~g}}{0.2 \mathrm{dm}^{3}}=250 \mathrm{~g} / \mathrm{dm}^{3}$
